The idea of this project is to provide an online platform for users to buy and sell sneakers. A user would be able to buy and review the latest sneaker collection and list their own sneaker collection for selling.

Core Features:

- Landing page: A landing page to display the latest sneaker collection and features of the platform with latest offers.
- Sneaker listing page: A list of all the latest sneaker collection available on the website along with their prices with search to look for a particular product and filters to search by different filters.
- Individual sneaker page: A page with all the sneaker details with their full description along with the available sizes and prices. You can also find reviews about the product.
- Add sneaker page: A page where user can post their listing for a shoe or edit their existing listing along with the description, available sizes and the price.
- User profile: A user profile page to display the user information along with the orders placed and the listings posted.
- Add a review: A user would be able to post reviews about different sneakers along with ratings.
- Notifications: If a product is out of stock, user can click on “notify when available” button, then the user gets notified when the seller restocks it.

Extra Features:

- Q and A's: A user would be able to post questions about a particular sneaker and users would be able to answer these questions on the individual sneaker page.
- Report inappropriate review and question or answers using an admin account.
- Social media integration.
